Α	NEXO I: LISTADO DE BUENAS PRÁCTICAS Y RETOS ABIERTOS	17

### 1 INTRODUCCIÓN

El sector textil y de confección en Europa afronta diversos retos; debido a la crisis financiera, la competitividad de los mercados emergente o las demandas estacionales entre otros, el sector, uno de los más grandes y el más importante de toda Europa, para superar los desafíos existentes i previstos, necesita reevaluar su posición sobre uno de los factores más críticos que afectan su competitividad: las habilidades de su fuerza laboral, en relación con la posición estratégica de la UE sobre el conocimiento y la innovación, como ventajas competitivas.

Todos estos desafíos requieren profesionales altamente calificados, que deben tener la combinación adecuada de habilidades, tanto profesionales como transversales, para demostrar su competencia para la investigación aplicada, el desarrollo y la transferencia tecnológica. Además, se hace hincapié en la investigación y la innovación tanto en la academia como en las empresas; eso requiere que nos centremos en hacer que el triángulo del conocimiento funcione en la industria textil y de la confección, al vincular educación superior (ES), la investigación y los negocios, que son uno de los objetivos de las políticas de la UE.

Por lo tanto, la industria, ahora más que nunca, necesita mano de obra calificada para administrar las acciones de investigación e innovación; la aplicación de buenas prácticas y el dominio de las metodologías más avanzadas para transferir los resultados de la investigación al entorno laboral a través del trabajo real basado en proyectos centrados en la transferencia tecnológica son soluciones que responden eficazmente a estos desafíos.

#### **Propuesta**

El objetivo de *Textile Strategy for Innovative Higher Education* (TEXSTRA) es reunir a los principales actores del sector textil para promover y contribuir a la transferencia de conocimientos de investigación e innovación a estudiantes profesionales de la enseñanza del sector textil y de la moda basándose en la realización de proyectos, contribuyendo así a aumentar la eficiencia y competitividad de las PYMEs textiles de la UE.

En este contexto, el proyecto TEXSTRA ha desarrollado las herramientas necesarias para mejorar las habilidades en la educación superior, en relación con la investigación y la innovación. Uno de los resultados intelectuales del proyecto es el desarrollo del Manual de Buenas Prácticas y Retos Abiertos del proyecto: un conjunto de herramientas y metodologías de formación para fomentar la creatividad y la innovación dentro del sector de la fabricación de textiles y de moda.

Este informe resume las buenas prácticas e iniciativas respecto a toda la información relevante relacionada con el proyecto TEXSTRA y sus logros, así como los desafíos abiertos que deben abordarse en los países socios de este proyecto (Rumanía, Grecia, Italia, España, Portugal, Lituania y Bulgaria). Se espera que estas buenas prácticas sirvan como un marco útil y proporcionen información importante que represente una "lección aprendida", que se traspasará a los actores del sector, como por ejemplo empresas, centros de investigación, centros de formación, universidades, incubadoras, y clase política.

#### Esquema del estudio

Después de la introducción, el bloque 2 presenta la metodología usada para seleccionar las buenas prácticas

La Sección 3 resume las buenas prácticas y los desafíos abiertos identificados bajo los principales títulos, tales como: Producto, Proceso, Sostenibilidad, Marketing y Negocios.

Para finalizar, la Sección 4 resume algunos de los temas clave de las buenas prácticas y los desafíos abiertos.

La parte de anexos presenta una descripción de las 20 buenas prácticas y desafíos abiertos.

### 2 ENFOQUE Y METODOLOGÍA

La revisión de las buenas prácticas y los desafíos abiertos incluidos en este informe se ha encontrado a través de los sitios web respectivos o mediante entrevistas, reuniones con expertos y partes interesadas clave. Cada socio ha informado al menos dos sugerencias (una buena práctica y una cuestión abierta). Esta información se presenta en las siguientes secciones.

#### Recopilación de la información del formato

El formato para recopilar la información (Tabla 1) incluye 2 partes principales:

- La primera parte fue diseñada para obtener información general sobre las buenas prácticas / desafío abierto, p. título, período y fecha (en términos de años), organización responsable, cobertura geográfica, grupo objetivo, etc.
- La segunda parte fue diseñada para obtener información sobre las buenas prácticas / iniciativa o desafío abierto que podría beneficiar al proyecto TEXSTRA, tales como: resumen, lecciones aprendidas, aportes de innovación, sostenibilidad y otros detalles similares.

Tabla 1: Formato para recopilar información sobre buenas prácticas y retos abiertos

-			1

¿Cuál es el nombre que mejor describe la Buena Práctica (GP) o el Open Challenge (OC)?

	challenge (OC)?
□ Producto □ Procesos □ Sostenibilidad □ Marketing □ Negocio	Seleccione el tema que el GP o la dirección OC.
Año/Duración	Especifique el período durante el cual la práctica se ha llevado a cabo (plazo). ¿Se terminó?
Tipo	
Dirección web	¿Qué tipo de intervención incluye el GP / OC (por ejemplo, intervenciones tecnológicas y no tecnológicas: nuevo producto, nueva tecnología, nueva práctica ambiental, técnica de gestión, etc.)?
Organización responsable	·
Detalles del contacto	¿Dónde se puede encontrar y recuperar información en Internet?
Países participantes	¿Quién fue responsable de implementar el GP / OC?
Otras organizaciones implicadas	¿Cuál es la dirección / correo electrónico de las personas para contactar si desea obtener más información?
Resumen de buenas practices yr etos abiertos	
Grupos de interés	¿En qué países participaron las Buenas Prácticas / Desafío Abierto?
Impacto	¿Quiénes son las instituciones, agencias ejecutoras, donantes, etc. involucrados?
Innovación	¿Cuál es el objetivo / objetivo del GP / OC?
Limitaciones	¿Cuál es el contexto (situación inicial) y el desafío que se aborda? ¿Proporciona una breve descripción del GP u OC que se está abordando?
Factores de éxito	
Lecciones aprendidas	¿Quiénes son los beneficiarios / usuarios o el grupo objetivo? ¿A quién va dirigido este GP / OC?

#### Listado de Buenas Prácticas y Retos Abiertos

Sostenibilidad

Las buenas muestras de buenas prácticas y los desafíos abiertos en este informe se presentan bajo títulos principales como: Producto, Proceso, Sostenibilidad, Marketing y Negocios. Para cada Buena Práctica / Desafío Abierto, se ha otorgado un título que lo describe mejor.

En general, se informan 20 buenas prácticas / iniciativas y desafíos abiertos, ver Tabla 2. Más específicamente se informaron 11 proyectos, 2 nuevos productos, 1 taller, 1 nuevas prácticas ambientales, 1 nuevo modelo de negocio, 1 marca de moda sostenible, 1 exposición y 2 cúmulos.

Tabla 2: listado de Buena sprácticas y retos abiertos

# 3 SECTOR TEXTIL Y DE CONFECCIÓN: BUENAS PRÁCTICAS Y RETOS ABIERTOS

#### **PRODUCTO**

#### **BUENAS PRÁCTICAS**

#### 1. Apoyo ortopédico inteligente para fomentar la actividad de las personas mayores (Proyecto)

Este proyecto fue financiado por el Consejo de Investigación de Lituania. Su objetivo era desarrollar un soporte de punto ortopédico con elemento de calentamiento y recolección de energía durante la caminata.

Los resultados del proyecto se utilizan para el desarrollo del nuevo tejido ortopédico de apoyo y su promoción para personas mayores u otras personas que tienen algunas dificultades para caminar.

# 2. Trash-2-Cash: utilizando textiles y fibras de desecho de valor cero con tecnologías basadas en el diseño para crear productos de alta calidad (Proyecto)

Trash-2-Cash fue un proyecto de investigación financiado por la UE que tenía como objetivo crear nuevas fibras regeneradas a partir de residuos preconsumo y postconsumo. También fue pionero en una forma completamente nueva de desarrollar materiales.

Un recurso que se está volviendo más abundante es el desperdicio. La idea de reciclar los desechos textiles ha sido popular durante décadas, pero los métodos mecánicos actuales dan tejidos de baja calidad adecuados solo para aplicaciones industriales como el aislamiento, y el reciclaje de los desechos textiles pre-consumo en productos es imposible de escalar. Trash-2-Cash propuso un nuevo modelo en el que los desechos de papel y textiles se reciclan químicamente, lo que da como resultado telas de la misma calidad que los nuevos materiales, para hacer productos que sean industrialmente replicables e infinitamente reciclables.

#### **RETOS ABIERTOS**

#### 1. Desarrollo de estructura de textil 3D (Nuevo producto)

El contexto principal de este nuevo producto es desarrollar nuevas estructuras de textiles según las necesidades y posibilidades de la empresa industrial. Su objetivo es mejorar las habilidades de los estudiantes en el diseño textil y la comunicación con socios industriales, así como desarrollar nuevas estructuras de textiles para la fabricación industrial.

Los resultados del proyecto se pueden utilizar para la fabricación industrial, así como para la preparación de tesis de los estudiantes.

# 2. Datemats - Transferencia de conocimiento y tecnología de materiales y tecnologías emergentes a través de un enfoque (proyecto) basado en el diseño

El proyecto Datemats tiene como objetivo transferir e implementar un método de enseñanza único basado en el diseño para estudiantes con antecedentes mixtos (diseño e ingeniería) en el campo de los Materiales y Tecnologías Emergentes (EMT), y para impulsar las transferencias de conocimiento y tecnología de la academia y los centros de investigación a industria.

Los nuevos materiales y tecnologías representan un factor clave no solo para obtener mejores rendimientos y soluciones innovadoras, sino también para mejorar el lenguaje del producto en términos de nuevas experiencias y dimensiones sensoriales expresivas originales. Los materiales y tecnologías emergentes (EMT) están a la vanguardia en varios sectores y son uno de los elementos clave a través de los cuales las industrias estimulan los procesos de innovación y fomentan la creatividad. El panorama de los EMT requiere nuevos enfoques interdisciplinarios y transdisciplinarios en educación, industria y negocios. Al centrarse en los métodos de diseño, las habilidades empresariales, los factores socioculturales y los potenciales de innovación de los EMT, el proyecto Datemats contribuye a cumplir la tercera misión de la universidad, fortaleciendo el 'triángulo del conocimiento' al vincular la educación con la investigación y la innovación, estimulando el desarrollo social y económico.

#### 3. DESTEX - Diseño industrial y creativo en la fabricación textil avanzada (Proyecto)

El proyecto DESTEX fomentará la implementación de la innovación mediante el desarrollo de las herramientas necesarias para mejorar las habilidades con el fin de ayudar a los estudiantes de educación superior a adquirir habilidades en innovación transdisciplinaria, basadas en el diseño creativo e industrial aplicado al sector textil.

El sector de materiales textiles avanzados es un sector emergente dentro de la industria textil, impulsado por la innovación transdisciplinaria en varios mercados finales, que se centra en los aspectos técnicos y la contribución de los materiales textiles en lugar de la estética. Para fomentar el crecimiento de la innovación dentro de las empresas que operan en esos sectores, los sistemas de educación superior deben transferir el enfoque creativo aplicado en el diseño industrial y de productos a los programas de educación superior textil.

#### **PROCESO**

#### **BUENAS PRÁCTICAS**

#### 1. Conferencias sobre materiales textiles avanzados con propiedades electroconductoras (Taller)

Los objetivos del taller "Logros innovadores y perspectivas de desarrollo de los materiales avanzados con propiedades electroconductoras" fueron:

- Transferir conocimientos al personal interno involucrado en actividades de investigación y PYMES para aumentar el interés en materiales avanzados y la co-creación del material textil avanzado con propiedades electroconductoras.
- Crear vínculos con los proyectos Erasmus + (TEXSTRA y FOSTEX, Skills4Smartex), que tienen objetivos similares para ayudar a la creación de material textil avanzado e impulsar la industria textil a través de nuevos objetivos.

#### 2. PRACTICE for competence (Proyecto)

El proyecto está financiado por el Programa Operativo de Capital Humano 2014-2020 Eje prioritario 6 - Educación y habilidades, Objetivo temático 10 - Hacer inversiones en el campo de la educación, la capacitación y la capacitación profesional para adquirir habilidades y aprendizaje permanente.

El objetivo general del proyecto tiene como objetivo desarrollar las habilidades prácticas para los estudiantes de los campos de Ingeniería Industrial e Ingeniería y gestión, especializaciones específicas en el campo de los textiles y el vestido, a través de pasantías en las principales empresas de las regiones del Nordeste y Sudeste , para integrarse con éxito en el mercado laboral. Los estudiantes se beneficiarán de pasantías guiadas, realizadas tanto en los laboratorios tecnológicos de la facultad como en compañías prestigiosas en el campo, métodos de aprendizaje modernos, becas en caso de estudiantes de áreas rurales, premios atractivos para concursos organizados dentro del proyecto.

#### **RETOS ABIERTOS**

# 1. Aceleración de la innovación en materiales textiles avanzados a través de tecnologías y procesos avanzados (Nuevo producto)

El desafío abierto es desarrollar sistemas y compuestos híbridos inteligentes en 3D mediante la investigación, prueba y optimización de los rendimientos físico-mecánicos, eléctricos, físico-químicos para materiales compuestos 3D diseñados para los campos de nicho (electrónica, física de materiales, electrotécnica y medicina).

# 2. Implementación de pasantías virtuales en currículos de educación superior en TUIASI, Facultad de Diseño Industrial y Administración de Empresas (Proyecto)

La naturaleza del desafío abierto propuesto es educativo. Los proyectos desarrollados en las pasantías virtuales en colaboración con empresas de T&C se centrarán en cuestiones tecnológicas y no tecnológicas que las empresas considerarán importantes. Los objetivos principales son:

- Mejorar la experiencia de pasantía para estudiantes y desarrollar sus habilidades transversales.
- Mejor comunicación entre empresas, estudiantes y personal académico.
- Crear conciencia sobre la necesidad de mano de obra calificada para la industria de T&C.

#### **SOSTENIBILIDAD**

#### **BUENAS PRÁCTICAS**

#### 1. Sustitución de productos químicos peligrosos en el acabado textil (nueva práctica medioambiental)

El objetivo principal de esta nueva práctica ambiental es contribuir a la mitigación de los impactos ambientales y de salud en los ecosistemas europeos causados por compuestos tóxicos utilizados en el sector de acabado textil que están dentro del alcance de las posibles restricciones de REACH.

Muchos principios activos de acabado textil de alto rendimiento conocidos han demostrado ser tóxicos o peligrosos para el medio ambiente. Estas instituciones europeas están abordando estos problemas a través de la legislación REACH limitando su uso e incluso con prohibiciones del uso de sustancias.

#### 2. Fibersort - Cerrando el ciclo en la industria textil (Proyecto)

FIBERSORT es un proyecto INTERREG del noroeste de Europa. Busca abordar dos desafíos principales: la necesidad ambiental de reducir el impacto de los materiales textiles vírgenes, así como el desarrollo de nuevos modelos de negocios y mercados abiertos para las cantidades crecientes de textiles reciclables en el noroeste de Europa (NWE).

Para permitir este cambio, el proyecto espera realizar la implementación de la tecnología Fibersort como el nuevo estándar de la industria y un paso clave de valor agregado para permitir el reciclaje de textil a textil de alto valor en la región.

El Fibersort es una tecnología que clasifica automáticamente grandes volúmenes de textiles mixtos postconsumo según la composición del material. Esto les permite ser reciclados en nuevos textiles de alta calidad. Una vez clasificados, estos materiales se convierten en insumos confiables y consistentes para recicladores textil a textil de alto valor. Las tecnologías de reciclaje de alto valor pueden transformar los desechos de bajo valor en nuevos textiles de alto valor y son un eslabón crítico en la cadena de suministro circular. Por lo tanto, Fibersort es una tecnología clave que permitirá que los recursos textiles circulen repetidamente por la cadena de suministro.

#### **RETOS ABIERTOS**

#### 1. Economía circular y diseño ecológico (nuevo modelo de negocio)

Actualmente, muchos productos no son reciclables debido a restricciones de diseño y debido a la falta de contabilidad del aspecto de fin de vida útil durante el diseño.

El objetivo principal de este desafío abierto es convertir la industria textil de una industria lineal desde la cuna a la tumba en un modelo circular a partir del diseño con diseño ecológico para permitir la circularidad de los productos textiles.

#### 2. RESYNTEX - Un nuevo concepto de economía circular para textiles y productos químicos (Proyecto)

RESYNTEX fue financiado por el Programa de Investigación e Innovación Horizonte 2020 de la UE. Es un proyecto de investigación que tiene como objetivo crear un nuevo concepto de economía circular para las industrias textil y química. Mediante la simbiosis industrial, su objetivo es producir materias primas secundarias a partir de residuos textiles no desgastables. Es un nuevo enfoque para diseñar una cadena de valor completa desde la recolección de residuos textiles hasta la generación de nuevas materias primas para productos químicos y textiles. En particular, buscaron reemplazar el amoníaco con productos químicos de valor agregado basados en oligómeros de poliamida de origen textil, fenol-formaldehído con componentes a base de proteínas en adhesivos, productos petroquímicos para el envasado con ácido tereftálico reciclado recuperado de poliéster, combustibles de transporte a base de fósiles con bio- a base de etanol.

RESYNTEX no pudo validar la viabilidad de los conceptos propuestos utilizando análisis LCA y LCC. Los impactos ambientales calculados y los costos de RESYNTEX se compararon con la cadena de valor convencional (incineración) aplicando análisis combinados de LCA y LCC. El atractivo de los productos originalmente propuestos se clasificó mediante el análisis combinado, y ninguno fue realmente viable.

Los procesos propuestos necesitan identificar los principales contribuyentes al impacto y los costos de cada ruta, y estos pueden usarse para mejorar el rendimiento del sistema y su optimización.

#### **MARKETING**

#### **BUENAS PRÁCTICAS**

# 1. ExtroSkills: Desarrollando nuevas habilidades para las especializaciones de extroversión de la industria de la moda en Europa (Proyecto)

Las industrias de la moda necesitan una fuerza laboral flexible que responda al desarrollo del mercado globalizado y a la tendencia y la necesidad de internacionalización. La fuerza laboral debe estar bien calificada y lista para enfrentar la mayor competencia y los rápidos cambios tecnológicos. Para poder competir en el mercado global, las industrias de la moda deben ser más inteligentes y capaces de adaptarse a los cambios. Para lograr esto, las industrias de la moda necesitan nuevos sistemas y herramientas de

educación y capacitación para su fuerza laboral existente y potencial a fin de responder a las demandas del mercado laboral y la competencia global. En un marco de competencia global, la innovación y el desarrollo son elementos cruciales para dar un nuevo impulso a una industria sostenible y competitiva.

En este contexto, el proyecto EXTRO SKILLS ha diseñado y desarrollado un protocolo de capacitación innovador e integral para el personal de exportación de las industrias de la moda, utilizando enfoques y metodologías de aprendizaje basados en las TIC que ofrecen habilidades transversales esenciales para permitirles estar preparados para responder al comercio y al mercado internacional. exige y mejora la extroversión y la competitividad de la industria en su conjunto. Al reunir a los diferentes sectores de las industrias de la moda, el protocolo de capacitación sigue un enfoque integral centrado en el alumno y se combina con un marco de certificación integrado, basado en los conocimientos adquiridos, habilidades y competencias, en línea con el Marco Europeo de Calificación (EQF).

#### 2. Vintage por una causa (marca de moda sostenible)

"Vintage por una causa" es una marca portuguesa que combina la preocupación medioambiental con la responsabilidad social. Fabrica ropa y accesorios de moda, basados en principios de sostenibilidad ambiental, pero con el propósito de promover la sostenibilidad social.

Diseña y fabrica la mayoría de sus colecciones de edición limitada realizadas por socios fabricantes responsables en Portugal o en el extranjero utilizando métodos y materiales sostenibles. Se abastece de tejidos muertos y sostenibles que incorporan mejores prácticas en toda la cadena de suministro para crear hermosos estilos inspirados en la vendimia en una fracción del impacto ambiental de la moda convencional. Es su misión liderar e inspirar una manera sostenible de hacer moda.

Comenzó como un proyecto en el área de la sostenibilidad social que promueve la interacción y la convivencia de las mujeres mayores de 50 años, en el rediseño de prendas vintage.

Hoy se convirtió en un espacio de producción de ropa con principios de sostenibilidad ambiental (trabajando en el ciclismo), cuenta con la colaboración de prestigiosos diseñadores portugueses, que contribuyen voluntariamente con su conocimiento y talento para que las transformaciones de la ropa vieja se hagan en equipo con de mujeres mayores. Todo se hace con materiales existentes y, a menudo, dos piezas dan como resultado una completamente diferente. El resultado final son piezas vintage únicas, que se venden en mercados y tiendas. Cada producto recibe una etiqueta bordada a mano que va acompañada de un breve texto que cuenta la historia de la pieza, de dónde vino, quién la transformó y una invitación al futuro propietario para compartir la continuidad de su ruta en Internet.

El desafío hoy es la replicación de este modelo de negocios programado para otras ciudades del país. También el desafío es la búsqueda de nuevos socios textiles (con existencias muertas de textiles), con el fin de obtener donaciones de materiales para poder trabajar nuevas prendas siempre en el proceso de ciclismo ascendente.

#### **RETOS ABIERTOS**

#### 1. FOSTEX: Fomento de la innovación en la industria textil de Jordania y Marruecos (Proyecto)

La idea del proyecto FOSTEX es un ecosistema local de innovación en el sector textil. El objetivo principal de esta iniciativa es fomentar la colaboración universidad-industria, apoyar el desarrollo de la innovación en el sector textil en Marruecos y Jordania y generar un ecosistema de materiales textiles avanzados.

La mejora de los centros existentes en Marruecos y la creación de nuevos centros de innovación en Jordania se convertirán en un valioso aliado para el sector textil local y su mayor desarrollo.

El proyecto FOSTEX cumple con la política industrial nacional de Jordania para los años 2017-2021 que tiene como objetivo desarrollar la competitividad en el área de costo de producción, calidad, certificación, exportación e innovación, alentando la investigación aplicada y la transferencia de tecnología de las universidades a la industria.

Del mismo modo, el Gobierno marroquí estableció un plan de aceleración industrial para los años 2014-2020, en el que una línea estratégica dedicada tiene como objetivo crear diferentes ecosistemas industriales para promover un desarrollo integrado de los sectores. Para el sector textil se identifican 6 ecosistemas, indicando a los Textiles Técnicos como uno de ellos.

La iniciativa tiene como objetivo establecer dos centros avanzados de innovación textil en Jordania y mejorar dos centros de innovación textil en Marruecos, además de:

- promover los centros convirtiéndolos en los puntos focales de la industria textil de cada país;
- Promover actividades empresariales en los cuatro centros para convertirlos en catalizadores regionales de innovación.
- para mostrar los resultados de FOSTEX y alentar a los gobiernos marroquíes y jordanos a replicar las iniciativas en otras universidades.

#### **NEGOCIO**

#### **BUENAS PRÁCTICAS**

#### 1. TEXTAILOR EXPO (Exhibition)

La exposición TEXTAILOR EXPO es muy apreciada por atreverse a combinar y presentar en un solo lugar máquinas textiles y moda, productos producidos en masa y artículos hechos a mano, marcas establecidas y nuevas empresas, conocer alumnos, estudiantes y jóvenes diseñadores con estilistas de renombre mundial. para transferir experiencia y habilidades en Creative Lab, para albergar conversaciones de negocios y capacitación profesional.

La exposición internacional especializada de moda, equipos y productos textiles TEXTAILOR EXPO es del tipo "Business-to-Business" (B2B). Une representantes de toda la cadena de suministro. Es un foro de negocios para fabricantes, subcontratistas y comerciantes, que se ha establecido como un importante centro de la industria de la moda en la Península de los Balcanes.

TEXTAILOR EXPO muestra tecnologías modernas, máquinas, materiales, accesorios para la industria textil y de la confección, prendas confeccionadas de tejidos y prendas de punto, líneas de moda. Esta exposición muestra las dos caras de la industria de la moda: las búsquedas estéticas y las innovaciones tecnológicas, por lo que la exposición es útil para profesionales e interesante para el público en general.

#### 2. Instituto de clúster especializado en indumentaria y textil - SCIAT (Cluster)

El clúster SCIAT se encuentra en Bulgaria. Es una estructura comercial para fabricantes, subcontratistas y comerciantes.

El equipo detrás del Instituto de Clúster Especializado para Ropa y Textil ha estado trabajando juntos desde 2005 cuando fundó el Instituto Especializado para Ropa y Textil. Ofrece servicios de consultoría en el campo de las industrias textil y de confección; proporcionando capacitación en todas las etapas de producción, planificación del ciclo de producción, gestión y comercialización de empresas que operan en los campos mencionados anteriormente u otros campos relacionados.

En el curso de su larga presencia activa, la organización ha adquirido una valiosa experiencia y conocimientos relacionados con la industria textil en Bulgaria y los problemas y perspectivas de este campo.

#### 2. Po.in.tex. (Cluster)

Textile Innovation Cluster, una asociación de empresas, consorcios y centros de investigación, establecida en Biella por la Región Piemonte y gestionada por Città Studi. Este Clúster se centra especialmente en uno de los sectores más importantes de la economía italiana, la industria textil.

Desde su fundación, el objetivo es promover los valores de innovación cooperativa y competitividad, al tiempo que se fomenta un intercambio constante entre la oferta y la demanda de innovación. Hay un llamado particular en una esfera territorial que conecta fuertemente este Clúster, su misión y sus actividades, con la industria textil que todavía marca el distrito de Biella y toda la Región Piemonte. El Cluster de innovación textil incluye y sirve a varios miembros que pertenecen a cada parte del sector de producción y fabricación textil.

#### **RETOS ABIERTOS**

#### 3. TCBL Textile & Clothing Business Labs (Project)

TCBL Textile & Clothing Business Labs es un programa Horizon 2020 de la Unión Europea para investigación, desarrollo tecnológico e innovación. Su objetivo es construir un ecosistema empresarial multifacético de empresas del sector, laboratorios de innovación, proveedores de servicios y asesores que trabajen juntos para transformar la industria textil y de la confección. El objetivo común es construir caminos alternativos y sostenibles hacia la sobreproducción y la disminución del valor.

El objetivo del Proyecto TCBL ha sido crear un ecosistema empresarial transformador capaz de innovar constantemente los modelos de negocio y proceso de la industria textil y de la confección europea. A

medida que los clientes muestran cada vez más atención a la sostenibilidad ética y ambiental en la ropa que visten, están surgiendo oportunidades significativas para enfrentar este desafío en base a nuevas tecnologías de producción y distribución, modelos organizacionales innovadores y nuevas energías creativas. Si estas oportunidades se capturan adecuadamente a través de la innovación del modelo de negocio, estas tendencias tienen la promesa de reestructurar radicalmente una de las industrias más amigables con el medio ambiente y más orientadas al consumo del mundo.

#### 1. Smart Orthopaedic Support to Encourage Activity of Elderly People

1. Smart Orthopacate Support to Encourage Activity of Elacity ( Copic		
	Product	
Year/Duration	01.10.2017 - 31.12.2019	
Туре	Project is financed by Research Council of Lithuania	
Web Address	NA	
Responsible Organisation	KTU and Lithuanian Sports University	
Contact Details	daiva.mikucioniene@ktu.lt	
Countries participating	Lithuania and Latvia	
Other Organisations involved	Riga Technical University, industrial company of orthopaedic supports manufacturing	
Summary of Good Practice	To develop orthoapedic knitted support with warming element and power harvesting during walking.	
Target groups	Elderlies and other people who would like to support their physical activities.	
Impact	Results of the project is used for new orthopaedic knitted support development and promotion them for elderly people or other people who have some difficulties with walking.	
Innovation	The new product is under patenting.	
Constraints	To develop new earlier do not used product, to combine a knowledge of different peoples in different fields of science and industrial manufacturing into one object, understanding a full complex of problems and challenges.	
Success Factors	Financial support of new product development, understanding of problem from different points of view, contribution of peoples with different knowledge and experience in various fields of science and industrial manufacturing.	
Lessons learned	Life learning, contribution of peoples from various fields of activities and working in a group are the key factors for absolutely new product development.	
Sustainability	Total budget of project implementation is approx. 100 000 EUR. International, interdisciplinary research institutions and industrial companies contribution, dissemination of project results in conferences and research papers, practical usage of research results, involvement of students into practical research, new product development and patenting	

# 2. Trash-2-Cash: utilising zero-value waste textiles and fibres with design-driven technologies to create high quality products

**Product**  $\boxtimes$  Product  $\square$  Processes ☐ Sustainability ☐ Marketing ☐ Business Year/Duration June 2015 - December 2018 Trash-2-Cash was an EU funded research project which aimed to create new Tvpe regenerated fibres from pre-consumer and post-consumer waste. It was also pioneering a whole new way of developing materials. Web Address www.trash2cashproject.eu Responsible Organisation RI.SE - Research Institutes of Sweden Contact Details For research enquiries contact, RI.SE: emma.ostmark@ri.se For media enquiries contact, Centre for Circular Design: ccd@arts.ac.uk Countries participating 18 partners from 10 EU countries: Denmark, Finland, Germany, Italy, Slovenia, Spain, Sweden, The Netherlands, Turkey, UK. Other Organisations involved Aalto University (AALTO), Copenhagen Business School (CBS), Fundacion Cidetec, Grado Zero Innovation (GZI), Maier, Material ConneXion Italia (MCI), Reima, SCA Obbola, SOEX, SO.F.TER, Soktas Dokuma, Swerea IVF, TEKO, Tekstina, University of the Arts London (UAL), VanBerlo, VTT Technical Research Centre of Finland One resource that's becoming more abundant is waste. The idea of recycling Summary of Good Practice textile waste has been popular for decades, but current mechanical methods give poor quality fabrics suitable only for industrial applications like insulation, and upcycling of pre-consumer textile waste into products is impossible to scale. Trash-2-Cash proposed a new model where paper and textile waste is recycled chemically - resulting in fabrics that are the same quality as new materials, to make products that are industrially replicable and infinitely recyclable. Stakeholders of the textile value chain: material R&D (engineering/design), Target groups product development (design). Designers, design researchers, scientists, raw material suppliers and product manufacturers from across Europe made up a cross-disciplinary consortium representing the whole product supply chain. T2C has achieved high quality materials and product prototypes from waste, **Impact** offering companies in various industries (fashion, interiors, automotive and other luxury goods) new eco-fibre options. T2C consortium partners also hope to influence how all novel materials are Innovation developed in the future through Design-Driven Material Innovation (DDMI) methodology. This new way of working will outline how science, design and industry can input into the process from beginning to end. **Constraints** Availability for collaboration in a cross-disciplinary and inter-sectorial context. Success Factors Need to facilitate communication and collaboration between the different involved professions in order to achieve the pre-set goals.

Other Organisations involved Textile companies

Summary of Open Challenge Aims:

– to improve students skills in textile designing and communication with industrial partners;

- to develop new structures of textile for industrial manufacturing.

Context – to develop new structures of textiles according needs and possibilities of industrial company.

Target groups Students and industrial textile companies

Impact Students obtains additional skills in textile designing, communication with

industrial partners, working in a group. Industrial partners obtains new

design of product for their manufacturing.

Innovation Innovation in new 3D product development.

Constraints Challenges for student to use their theoretical knowledge in practice and

challenges for companies to adapt new view on product designing and new  $\,$ 

kind of product manufacturing.

Success Factors Willingness of industrial company and student to implement project.

Lessons learned Practical internship for students.

Sustainability The results of project can be used for industrial manufacturing as well as for

 $student's\ thesis\ preparation.$ 

# 4. Datemats - Knowledge & Technology Transfer of Emerging Materials & Technologies through a Design-Driven Approach

Countries participating

10 partners from **6** EU countries: Denmark, Italy, Finland, Portugal, Spain, Sweden.

Other Organisations involved

Aalto University - CHEMARTS (AALTO)

Barcelona Design Center (BCD)

Centro Italiano per l'Apprendimento Permanente (CIAPE) Industrial Design Development Center West Sweden (IDC)

Instituto de Soldadura e Qualidade (ISQ)

Copenhagen School of Design and Technology - Material Design Lab (KEA)
Fostering Arts and Design - Barcelona Materials Centre (MATERFAD)

Material ConneXion Italia (MCI)

University of Navarra - Faculty of Engineering (TECNUN)

Summary of Open Challenge

New materials and technologies represent a key-factor not only to obtain better performances and innovative solutions, but also to enhance the product language in terms of new experiences and original expressive-sensorial dimensions. Emerging Materials and Technologies (EMTs), are at the leading edge in several sectors and are one of the key-elements through which industries stimulate innovation processes and foster creativity. The landscape of EMTs requires new interdisciplinary and transdisciplinary approaches in education, industry and business. By focusing on design methods, entrepreneurial skills, socio-cultural factors, and innovation potentials of EMTs, Datemats project contributes to fulfil the university's third mission, strengthening the 'knowledge triangle' by linking education with research and innovation, stimulating the social and economic development.

Target groups

The Datemats activities are open to faculty, students and enterprises and will offer several occasions in which the involved universities will share their best practices for knowledge and technology transfers. The mentioned stakeholders will be involved in several activities aimed to transfer new knowledge and methodologies to learn to detect and exploit the potentials of emerging materials and technologies gaining new skills, methods, expertise, competitiveness.

Impact

The project aims to support cross-fertilisation, exchange of good practices and mutual learning and to foster the definition of new interdisciplinary methods for EMTs. This means to work on the implementation of the new design teaching method during the project lifetime, but mainly to build up interest and a critical mass on the subject and to develop an active community after the project closure, for continuous training of the future and existing workforce, that will enable the European industrial workforce to

develop new skills and competences in a quick and efficient way. Faculty from HEIs will have the largest impact, ensuring sustainability and longevity for the project. This is because the academy will provide a unique, high quality process for cross-institutional teams to develop and implement change programmes in the curriculum.

Innovation New teaching methods for higher education applying an interdisciplinary and trans-sectorial design-driven approach.

Difficulties in reaching out to industry for an active involvement and contribution.

Thanks to dedicated workshops involving design and engineering students, the Datemats consortium will be able to verify if and how the students learnt and applied both the design and the entrepreneurial skills addressing business needs.

The results of the workshops will be useful to stress the pros and the cons of the method and, if necessary, how and what to improve for further development.

The initiative is co-financed under the European Commission's Erasmus+ Programme, Key Action 2 – Knowledge Alliances, with a budget of over € 900′000.

**Constraints**

Other Organisations involved

Summary of Good Practice

**INCDTP** 

N/A

Dr. Eng. Aileni Raluca Maria

Romania

The host of the event was INCDTP, Bucharest, Romania, and the funds were received through National Research Project "Composite materials with electroconductive properties, based on 3D polymeric array for sensorial monitoring system and electromagnetic waves attenuation (3D – ELECTROTEX)", contract PN 19 17 01 01, funded by Ministry of Research and Innovation (<a href="http://www.research.gov.ro">http://www.research.gov.ro</a>) in 2019

#### The objectives of the good practice are:

- to transfer the knowledge to internal staff involved in research activities and SMEs in order to increase the interest in advanced materials and cocreation of the advanced textile material with electroconductive properties.
- to create links with Erasmus+ projects (TEXSTRA and FOSTEX, Skills4Smartex), which have similar objectives in helping the creation of the advanced textile material and boosting the textile industry through new targets.

#### **Provided skills:**

- -advanced knowledge in the field of electroconductive materials obtained by classical technologies and advanced technologies (3D printing, RF plasma, and microwave);
- -knowledge about polymers used for electroconductive materials;

#### Some of the lectures are:

- 3D Electrotex –perspectives in developing advanced textile materials and intelligent textile prototypes with integrated circuits for sensors or actuators –Aileni Raluca Maria
- Research concerning the electromagnetic shield development based on textile materials –Surdu Lilioara
- Polymers with electroconductive properties, used in printing, padding, and coating –Aileni Raluca Maria
- o Conductive textile materials based on CNT Chirila Laura
- o e-Learning training modules in the field of textiles Radulescu Razvan
- Best practices for developing advanced textile materials research centers (FOSTEX Erasmus +) - Aileni Raluca Maria
- Perspectives for creation of the course supports for advanced textile materials (Texstra Erasmus +) - Aileni Raluca Maria

#### Target groups

The best practice presented was addressed to:

- Scientific group: researchers, assistant researchers, and Ph.D. students from INCDTP.
- To target group from business: engineers and scientific managers from SMFs.

**Impact** 

The positive impact of this good practice on target groups (academia, research, and business) consists of an understanding of the actual dynamic of the textile industry and to boost the interest in a research collaboration between the research organizations and SMEs. Also, the involvement of the internal research team (assistants, technologists, researchers) in this workshop was positively appreciated and have been generated several exciting discussions about the co-creation of new advanced textiles products.

Innovation

**Constraints** 

Success Factors

The best practice contributes to innovation by:

- more understanding of the project, co-interesting the research team;
- -clarifications about advanced materials, technologies, processes, and final products;
- -discussions and co-creation of the possible solutions to improve or optimize the final products

Difficulties consisted of impossibility for some of the participants to be present in the workshop for 1 day because of the busy program in SME.

All participants declared that it was an excellent experience to understand new researches and to understand the importance of the advanced materials developed in the final system. Besides, SMEs were very enthusiastic concerning the new possibility to know and to be involved in future research projects with INCDTP. The conditions are:

- To organize a seminar/workshop for advanced materials;
- To presents several aspects which already are connected with ongoing research or Erasmus+ projects;
- To get funding for organizing the event (workshop/seminar) and generate a significant impact and disseminate the results.
- To establish the appropriate date for the event in order to allow the participation of a broad public from science, business, and academia.
- To have the necessary logistics infrastructure (notebook, video projector, smart table, and .pptx presentations) and available chairs, keynote speakers, and speakers (researchers involved in the research/Erasmus+ projects).

Lessons learned

The key message from the best practice is that co-creation and coaching in advanced textile development can be used by meeting all interested stakeholders (SMEs, research organizations, academia, and students). The lessons learned to take away from the best practices are:

- -knowledge about raw materials and conductive polymers for advanced textiles
- -processes and technologies used for advanced textiles development
- -information about courses on advanced textile development provided by TEXSTRA Erasmus+
- -information about main aspects concerning the development of advanced textile centers (FOSTEX Erasmus+).

Sustainability

The total costs incurred for the implementation of the best practice was around 500 EUR. The institutional, social, economic and/or environmental benefits compared to total costs consist of:

- improving the communication of the work team in research and developing new advanced textiles with electroconductive properties;
- -increasing the interest of SMEs in new researches and collaboration in research/innovation projects with research institutes;
- -brainstorming about new advanced textiles and research projects;
- -dissemination of the project results (3D-Electrotex, TEXSTRA) and communication about project activities (FOSTEX, Skills4Smartex).

#### 7. PRACTICE for competence

Other Organisations involved

ASTRICO Nord-Est Association, PANDORA's PROJECTS Association

Summary of Good Practice

The general objective of the project aims to develop the practical skills for students from the fields of Industrial Engineering and Engineering and management, specializations specific to the field of textiles and clothing, through internships at top companies in the North-East and South-East regions, in order to integrate successfully in the labor market.

Students will benefit from guided internships, conducted both in the technological laboratories of the faculty and in prestigious companies in the field, modern learning methods, scholarships in case of students from rural areas, attractive prizes for competitions organized within the project,

Target groups

220 BSc students from the Faculty of Industrial Design and Business Management enrolled in the 2-nd, 3-rd and 4-th year of study in the fields of Industrial Engineering and Engineering and Management.

Impact

Increasing the number of tertiary and non-university tertiary education graduates who find a job as a result of access to learning activities at a potential job / research / innovation, focusing on the sector of Textiles & Clothing.

Establishing a minimum of 15 sustainable partnerships between the university and economic agents in the field of textiles and clothing.

Creation of an online learning platform for the development of workplace learning programs.

Creating a network of practice partners with an impact on the development of the practice component of the curricular offer.

Innovation

Students in the last year of study can prepare their graduation thesis at prestigious companies in the field that can propose themes / new products / challenges / to be developed within their thesis.

Constraints

The project allows the inclusion of companies located only in the NE and SE regions, although the textile and clothing sector is widespread throughout the country and the faculty is the most important provider of higher educated workforce.

Success Factors

Accessing new funds / new calls to finance the students' practice Creating a stable network of practice partners throughout the country.

Lessons learned

Awareness of the demand for knowledge and skills in industry.

Use the internship as a tool for adapting the content of the curricula and activities to the specific needs of the industry.

#### Sustainability

- -Total budget for the project implementation: approx. 421000 EUR
- -Efficiency indicators (selection): 15 partnership agreements; 220 framework conventions for practice; 15 groups of students per practice centers;
- -Benefits: 220 students will use the online platform; 1 coordinated information network; guided internships; modern methods of learning; scholarships for students from rural areas; access to prestigious companies in the field; higher chances of employment.

Summary of Open Challenge

The proposed open challenge addresses the theme 'Processes'.

2019-2022. The open challenge is ongoing.

The open challenge includes technological interventions such as material functionalization by RF plasma and microwave and 3D printing. The objective is to obtain new advanced textile products with electroconductive properties that could be used in systems based on sensors/actuators and magnetic shielding.

N/A in 2019.

The information will be available on the project website in 2020.

Also, some approaches and results are presented in scientific papers, such as: 1.Aileni R. M., Chiriac L., Research on designing composite techniques for obtaining the 3D hybrid composites with conductive and semiconductive properties for sensors and actuators, TEXTEH 2019, Bucharest, Romania

2.Aileni R. M., Chiriac L., Composed techniques for obtaining of the 3D hybrid composites for attenuation of the electromagnetic field, TEXTEH 2019, Bucharest, Romania

3.Aileni R. M., Chiriac L., Perspectives in using of the 3D textile composites to produce rechargeable batteries, TTPF 2019, Iasi, Romania

4.Aileni R. M., Chiriac L., Multivariate analysis of the parameters that the EMR absorption/shielding of the textile surface coated using nickel/graphite/copper microparticles, TTPF 2019, Iasi, Romania

**INCDTP** 

Romania

Dr. Eng. Aileni Raluca Maria

Ministry of Research and Innovation (http://www.research.gov.ro)

The scientific actions were funded in 2019 by the Ministry of Research and Innovation, Romania.

The scientific actions will be funded in 2020 by the Minister of Education and Research, Romania.

#### The objectives of the open challenge are:

- -to provide research and innovation actions about 3D rapid prototyping, RF plasma and microwave for 3D smart textiles based on a polymeric matrix
- -to study the context and the best practice for use, apply and recycle the materials used in smart textile (textile surface, metal micro/nanoparticles, electronic parts).
- -to foster the development of the hybrid textiles with electroconductive properties and to attract the SMEs in this research;
- -to evaluate the impact of the smart textile by life cycle assessment (LCA) and life cycle inventory (LCI)
- -to study, learn and disseminate the aspects concerning smart material performance and development

(properties (chemical, physic-mechanical, chemical and electrical), durability, resistance, reusing, recycling and disposal with a low impact on the environment).

-to study and disseminate to the external stakeholders (SMEs, research organizations, universities) and internal stakeholders (INCDTP) the aspects concerning the potential of using the advanced processes (RF plasma, microwave, and 3D printing) and aspects concerning potential toxicity of the micro/nanoparticle based on ferrous/non-ferrous metals used in smart textiles.

#### The context:

Today, in the context of textile industry 4.0, because of the technological developments advances in the fields of processes (RF plasma, microwave, and 3D printing) and the increased environmental challenges, for key domains (electronics, medicine/wellbeing, space, and electrical engineering), it is necessary to redefine the textile industry and reorient toward new development directions such as production systems, advanced textile materials, and products development. In this sense, it is necessary to use advanced processes, techniques, and methods for defining new textile innovative products such as smart textiles to be used in electronic systems and electromagnetic shielding.

#### **Open challenge description:**

The open challenge is to develop 3D smart hybrid composites and systems by research, testing, and optimization of the physical-mechanical, electrical, physical-chemical performances for 3D composite materials designed for the niche fields (electronics, material physics, electrotechnical and medicine).

The main target groups of stakeholders are from different areas, such as:

- → business: SMEs, textile clusters
- → academia/research: Representatives of professional associations and certification bodies, teachers and students from academia, researchers in the fields related to the textile industry
- → policymakers: Representatives of national and governmental authorities

  The positive socio-economical impact of the open challenge will be in generating innovation, redefining the textile business strategy, and increasing the European market share in smart materials. Also, it will generate increasing the European economy competitiveness, growing new companies, jobs, and increasing the employment rate.

The negative impact of the open challenge to the stakeholders, especially to the SMEs, can occur because the proposed challenge involves new advanced types of equipment, processes, and approaching new markets. Because of the development of new products, innovation and exploitation involve new business plans, new funding resources for purchasing the equipment, and new market strategies, and this can generate perhaps a negative impact at the beginning.

The open challenge will contribute to innovation by generating new advanced materials based on textiles appropriate to be used in the monitoring systems or electromagnetic shielding screens.

In addition, in the field of products and materials with electromagnetic properties, textiles can be integrated due to the flexibility and ability to integrate other materials (metallic particles, polymers doped with nanoparticles). By the versatile combination of materials with hydrophobic, oleophobic, hydrophilic, conductive, semiconductive, and insulating properties can be obtained components for sensors, actuators, and electromagnetic shielding necessary for the development of monitoring systems and flexible electromagnetic shielding screens.

In applying the open challenge, several predictable risks are on the industrial area (insufficient funds, delays in funding of the activities), social (human resources - personnel fluctuations), and technological risks.

Interdisciplinary research in the field of advanced textiles (physics, chemistry, engineering, materials science, computer science, mathematics, etc.) is a necessary field that illustrates the shift from economic activities based on the intensive exploitation of resources to activities based on knowledge, predictivity and time/resources economy.

The conditions (institutional, economic, social, technological, environmental, etc.) that need to be in place in SMEs in order to be a successfully

Target groups

Impact

Innovation

Constraints

Success Factors

technological transfer and to generate innovation are:

- -patents (national, EPO, International);
- -sufficient funding;
- -human resource high qualified (researchers);
- -the adequate technical infrastructure (types of equipment for advanced material manufacturing, types of equipment for textile functionalization, 3d printers, and testing types of equipment for testing (physic-mechanical, chemical, and electrical).
- -logistical infrastructure (performant ICT systems).

The key messages and lessons learned to take away from the OC are that it will be possible to generate the innovation and progress by multidisciplinary approaches in the textile industry, VET, HEI, and other education providers.

The total cost of the elements (industrial equipment, logistics, personnel costs) that need to be put into place for the open challenge to be institutionally, socially, technologically, economically, environmentally, etc. sustainable could be around 2 - 3 million of euros.

The institutional, social, economic, and/or environmental benefits compared to total costs are:

- -increasing the quality of the research within INCDTP and of the external visibility of the research results;
- development of international collaborations within the theme of the project;
- raising the level of qualification and specialization of masters, doctoral students, and young researchers;
- project proposals within the EU programs and other internationally funded programs;
- improving the scientific dissemination of the results through publications in international journals;
- increasing the market share of 3D composite textile products with electroconductive properties, EM shielding systems, wearable sensor, and actuator systems;
- increasing the performance of the products manufactured in SMEs by system production optimization, upgrading products by new functionalities, design for a sustainable society.

Lessons learned

Sustainability

## 9. Implementing Virtual Internship (VI) in Higher Education curricula at TUIASI, Faculty of Industrial Design and Business Management (IDBM)

and Business Management (IDBM)		
☐ Product ☐ Processes ☐ Sustainability ☐ Marketing ☐ Business ☒ Other: Education	Higher education	
Year/Duration	The estimated duration for the implementation of VI in TUIASI, faculty of IDBM is minimum two years.	
Туре	The nature of the proposed open challenge is educational. The projects developed in the Virtual Internships in collaboration with T&C companies will target technological and non-technological issues that companies will consider important.

LEITAT, Centexbel, CETIM, ATEVAL, CLUTEX, POINTEX, CSIC-IQAC

The main aim of this GP is to contribute to the mitigation of the environmental and health impacts on European ecosystems caused by toxic compounds used in the textile finishing sector that are under the scope of the potential restrictions by REACH.

Many well-known high performance textile finishing active principles have proved over time to be either toxic or hazardous for the environment. These problems are being address by European institutions through the REACH legislation by limiting their use and even with bans of the substance use.

European textile clusters and their SME members, with particular focus on finishing companies but also for the sector at large for better understanding of the problems behind.

Positive impact to finishers by comprehensively assessing and testing different alternative products at both lab scale and industrial scale, reducing their costs to substitution and implementation of safer alternatives.

For the sector at large, this means better access to knowledge, more information available and also to identify a point that many people is unaware,

This good practice was launch by a group of clusters along with technological centers in order to de-risk the substitution initiative to their members, enabling the testing and assessment of significant amount of alternatives and producing a benchmark of the different products for water and oil repellence and flame-retardants.

The main constrains in substitution of hazardous chemicals relies on two major aspects:

- Higher price of safer alternatives, caused by currently low production volumes as new products. This price gap can be closed with the scaling up of the substitution to bring production costs down by factor of scale.
- **Performance** between different products. In some cases the performance is critical and no substitutes are available, whereas in some other applications current products used are over-engineered with performance not required that could be safely switch to lower performance without notice by the final user but with a much friendlier impact to environment.

Success Factors

End-users needs to increase their awareness on the different products they use which might contain hazardous products or have a large impact to the environment. This needs to be link with policy to provide better information to consumers and more easily understandable labels to ensure safer and low environmental impact of the different products.

Producers of additives for textile finishing needs to educate the different value chain stakeholders to raise awareness on the more sustainable alternative products and scale them up in production to lower the prices.

Lessons learned

There are many sustainable alternatives to current products used for the textile finishing that many companies are unaware of and some products currently used are an overkill for the actual envisioned use and could be easily substituted cost effectively.

Sustainability

Many times substitution is not a matter of economics but rather on awareness. In the MIDWOR-LIFE project, it was demonstrated that substitution of PFOA and other perfluorinated products to paraffin, silicon and event dendrimers was similar or even cheaper for applications only targeting water repellence as a property with same performance.

Environmentally, the impact of substituting PFOA and other perfluorinated products mitigates the environmental impact by a factor 10 as demonstrated in the MIDWOR-LIFE project Life Cycle Assessment.

#### 11. Fibersort – Closing the loop in the textiles industry

Summary of Good Practice

Circular Economy

Duration: 4 years, Start date: 2016, Duration 48 months, Finish 2020

FIBERSORT is an INTERREG North-West Europe project

https://www.nweurope.eu/projects/project-search/bringing-the-fibersort-

technology-to-the-market/undefined#tab-1 Lead partner organization: Circle Economy - NL,

In the web site of the project, and also Cirvle Economy

other partners: Procotex Corporation S.A. – BE, Smart Fibersorting B.V. – NL, Stichting Leger des Heils Reshare – NL, Valvan Baling Systems – BE, Worn Again Technologies Ltd. - UK

The Fibersort Project seeks to address two main challenges: the environmental need to reduce the impact of virgin textile materials, as well as the development of new business models and open markets for the growing amounts of recyclable textiles in North-West Europe (NWE).

To enable this shift, the project expects to realise the implementation of Fibersort technology as the new industry standard and key value adding step to enable high value textile-to-textile recycling in the region.

The Fibersort is a technology that automatically sorts large volumes of mixed post-consumer textiles by material composition. This allows them to be recycled into new, high quality textiles. Once sorted, these materials become reliable, consistent inputs for high-value textile-to-textile recyclers. High value recycling technologies can transition low value waste into new, high value textiles and they are a critical link in the circular supply chain. Therefore, the Fibersort is a key technology that will enable textile resources to cycle repeatedly through the supply chain.

Textile collectors, sorters, and recyclers Target groups

Brands, retailers, and manufacturers

A new way of processing textile waste. Reduce textile waste and bring them **Impact** 

into the circular economy concept.

Demonstration of a Circular Economy Model, based on Textile Waste and use Innovation

it for a textile - to - textile mose.

**Constraints** Efficiently connecting with collectors, sorters and recyclers.

Success Factors It is based on the Fibersort Project, which started as Textiles 4 Textiles in

2010 continues until now, and it still seeks business case validation. The Fibersort process needs to be optimised with consideration for key parameters, such as fibre composition of inputs, production capacity, transport, waste and inputs costs, revenue streams, virgin resource prices,

and market demand.

Government and brand/retailer play a crucial role in supporting the Lessons learned transition towards circularity; governments can act as policy levers, encourage investment and sourcing of recycled, while brand/retailer has the

power to influence the purchase of recycled fibers.

Today, valuable pure fabric is down cycled during the textile recycling Sustainability process. The FIBERSORT allows to automatically sort this pure fabric, based

on fiber type into different categories. It uses scanning technology - NIR Spectroscopy. This is a spectroscopic technique based on molecular absorptions measured in the Near Infrared part of the spectrum. This technique is sensitive to organic constituents and since all textile is organic, there is no limit to the types of fiber that can be recognized. Since this process requires a feed of one piece at a time, the supply of the textiles to the system must also be piece by piece. This can be done manually by an operator that takes the items from a pile and puts them piece by piece on a conveyor belt. A color scanner on the same system, can separate specific colors or light colors from dark colors.

Circular economy and new business models

https://www.ellenmacarthurfoundation.org/

https://textils.cat/ecodistex/ https://www.trash2cashproject.eu/

Textile industry at large

n/a

All countries

Industry, European Commission, associations, SMEs, consumers organizations

The main aim of this open challenge is to convert the textile industry from a linear cradle-to-grave industry to circular model starting from the design with eco-design to enable circularity of the textile products.

Currently, many products are not recyclable due to design constrains and due to the lack of accounting the end-of life aspect during design.

Society at large, SMEs, textile companies, designers

Circularity of the textile industry will impact all society and industry, generating new business models, opportunities and products.

Current efforts in circular economy and eco-design brings in innovation at its core, since new approaches are needed to enable this open challenge success.

There are many challenges, from sourcing of end-of-life products, mixtures that complicates the recyclability, the global aspects of the textile value chain, and societal lack of awareness.

Fast fashion is currently a major constrain as it produces more and more waste product that is not recovered.

All stakeholders needs to go together and address the challenge from a global value chain perspective as it involves not only recovery and recycling at the end of the value chain but also designers at the beginning in order to design products that are better fit for end of life and re-use or upcycle.

Cooperation is growing in the field of eco-design and circular economy and partnerships across value chain and within other value chains are needed to tackle the different aspects involved.

Textile industry and fashion is considered the second more pollutant industry globally and increasingly impacting the environment due to the raise of fast fashion models.

The circularity and eco-design can have a massive positive impact mitigating major waste waster production and release.

#### 13. RESYNTEX - A New Circular Economy Concept for Textiles and Chemicals

10 different EU member states. DE,FR. EN, GR, SL,ES, LU,

Other Organisations involved

Summary of Open Challenge

RESYNTEX is a research project which aims to create a new circular economy concept for the textile and chemical industries. Using industrial symbiosis, it aims to produce secondary raw materials from unwearable textile waste. It is a new approach to Design a complete value chain from textile waste collection through to the generation of new feedstock for chemicals and textiles. In particular they looked at replacing Ammonia with value-added chemicals based on polyamide oligomers of textile origin, Phenol-formaldehyde with protein-based components in adhesives, Petrochemicals for packaging with recycled terephthalic acid recovered from polyester, Fossil-based transportation fuels with bio-based ethanol.

RESYNTEX failed to validate the viability of the proposed concepts using LCA and LCC analysis. The calculated environmental impacts and costs of the RESYNTEX were compared with the conventional value chain (incineration) applying combined LCA and LCC Analysis. Attractiveness of the originally proposed products were ranked using the combined analysis, and none was really viable.

The proposed processes need to identify the main contributors to the impact and costs of each route, and these can be used to improve the performance of the system and its optimization.

Target groups

Textile and clothing companies and Companies within the Chemical sectors

**Impact** 

A new source of feedstock for the chemical sector. Reduction of incineration of textile waste.

Validation of the LCA/LCC analysis.

Innovation

Demonstration of a Circular Economy Model, based on Textile Waste

Constraints

Chemical industry has an established and optimized operation model, based on conventional feedstock sources. New feedstock production methods must be well studied and optimized in order to be viable.

Success Factors

Improve the environmental and cost performance of proposed circular economy routes for textile waste by performing several LCA and LCC iterations.

Lessons learned

Apply a product-based approach in order to compare from the LCA/LCC point

of view alternative routes for the end-product. The combined LCA and LCC results allows the identification of the most promising routes, as it was with the case of the RESYNTEX programme. i.e. the transformation of protein-based textile material and PA textile material into respectively resin for wood panel and high-value chemicals, and in a lesser extent the depolymerisation of PE textile material to produce secondary PET. For cellulosic material, the hydrolysis into glucose juice to produce then bioethanol is not interesting from an environmental and cost point of view.

The results allowed also to identify the main contributors to the impacts and costs of each route, which served as a basis for improving the environmental and cost performances of the RESYNTEX system and could serve also for optimisation beyond RESYNTEX.

Sustainability

## LCA Analysis of the new methods.

This was a European Union funded project; its cost was high and no other company from the forefront of textile waste treatment could afford the development of the processes that were developed. In addition, its chemical intense knowledge requires specializations within the sector which are not available and most companies cannot afford.

## **MARKETING**

Summary of Good Practice

Fashion industries need a flexible workforce that responds to the development of the globalized market and the trend and need for internationalization. The workforce needs to be well qualified and ready to face the increased competition and rapid technological changes. To be able to compete in the global market, fashion industries have to be smarter and able to adapt to changes. To achieve this, fashion industries need new education and training systems and tools for their existing and potential workforce in order to respond to the demands of the labour market and the global competition. In a framework of global competition, innovation and development are crucial elements to provide fresh impetus to a sustainable and competitive industry.

In this context, the EXTRO SKILLS project has designed and developed an innovative and comprehensive training protocol for export personnel of fashion industries, using ICT-based learning approaches and methodologies that offer essential transversal skills for enabling them be ready to respond to international trade and market demands and enhancing the extroversion and the competitiveness of the industry as a whole. Bringing together the different sectors of fashion industries, the training protocol follow a comprehensive learner-centred approach and is coupled with an integrated certification framework, based on acquired knowledge, skills and competences, in line with the European Qualification Framework (EQF).

Target groups

SME's and individual Professional in Textiles and Clothing sector

Engagement of fashion industry in life long learning Multidisciplimany development team and approach Modern efficient and attractive curriculum Flexible delivery method and modular design Interesting and useful training material and methods

Lessons learned

Success Factors

- 1. The majority of the companies in EU level, need help to the following fields:
  - Creating overseas sales team (53%)
  - Finding trading partners (33%)
  - Intellectual property protection (30%).
- 2. Companies from Belgium, Portugal, Hungary, Bulgaria, France, Italy, Lithuania and Croatia are at 70% confident at e-learning which is the highest percentage. In general, the answer "Confident" is the most popular among the majority of the companies in every country except the UK where the majority of the companies answered that they are Not Confident at e-learning. Also, we have to mention the very high percentage of the answer "Very Confident" in Romania and the fact that none of the companies participated in the survey, answered that they are not confident at e-learning.
- 3. Exports are important for companies of the T&C sector, for the following reasons:
  - in order to Attract more consumers
  - New business model (14 companies)
  - Lessen competition & seasonal market
  - Development of New Business Model
  - Improve Cash Flow

Sustainability

Total cost of the project was 238 379 EUR, funded from ERASMUS +.

The main parameters that will assure the sustainability of the project, are:

- the updating of the learning content with examples and case studies.
- Possibility to apply on the job training and hands on experience.
- The enrichment of the learning experience with content in multimedia and other active methods and tools.
- Further exploitation of the outcomes, in collaboration with other training initiatives and actions.

In order to overcome the cost issues that these parameters need in order to be arranged, the project partners should examine the possibility to deliver the training program through a MOOC platform and/or other training programs.

Summary of Good Practice

Target groups

It is a Portuguese brand that combines environmental concern with social responsibility. It is business case of Good Practice (GP), which makes clothing and fashion accessories, based on principles of environmental sustainability, but with the purpose of promoting social sustainability.

Created in 2012, as a "Sewing Clubs" of occupational therapy for women who are no longer in an active professional life, today is a business model of sustainable fashion with social responsibility.

It design and manufacture the majority of theirs limited-edition collections are made by responsible manufacturing partners in Portugal or abroad using sustainable methods and materials. It source *dead-stock* and sustainable fabrics incorporating better practices throughout or supply chain to make beautiful vintage inspired styles at a fraction of the environmental impact of conventional fashion. It is their mission to lead and inspire a sustainable way to do fashion.

https://vintageforacause.pt/

Helena Silva the responsible for implementation of the VINTAGE FOR A CAUSE

info@vintageforacause.pt

Portugal and SKFK Ethical Fashion brand (an international brand).

The brand has the support of the Calouste Gulbenkian Foundation, with the Porto City Council, with several companies that donate textile waste, and with the collaboration of different organizations and partners to replicate social inclusion programs.

It started as a project in the area of social sustainability that promotes the interaction and conviviality of women over 50, in the redesign of *vintage* garments.

At the beginning it was a "Sewing Clubs", with a pilot course with 10 women who might not know how to sew. It took place in the city of Porto, in a convivial space that works as an occupational therapy for women who are no longer in an active professional life, but need a motivation to leave home.

Today it became a clothing production space with principles of environmental sustainability (working in *up cycling*), it counts with the collaboration of prestigious Portuguese designers, which contribute voluntarily with they knowledge and talent so that the transformations of the old clothes are made in team with de senior women. Everything is done with existing materials and often two pieces result in a completely different one. The end result is unique *vintage* pieces, which are sold at markets and stores. Each product gets a hand-embroidered tag that is accompanied by a short text that tells the story of the piece, where it came from, who transformed it and an invitation to the future owner to share the continuity of its route on the Internet.

The challenge today is the replication of this business model is scheduled for other cities in the country. Also the challenge is search for new textile partners (with textiles *dead-stocks*), in order to obtain material donations to be able to work new garments always in the process of *up cycling*.

The target group of the brand is consumers with environmental and social concerns who intend to purchase "limited edition garments" and exclusive pieces, vegan and handmade garments, with urban aesthetics and timeless design. Vintage for a Cause collections want to be timeless, suiting any season, and even gender.

The brand also has social concerns promoting the training of women over 50 outside of active life, through the creation of the association "From Granny to Trendy" a sewing clubs, (promoting workshops that culminate in a fashion catwalk), which t creating job opportunities. Also in these initiatives, which promote active aging, the participants discuss techniques for reusing and

transforming clothes. So far, the brand has integrated more than two hundred women in these circumstances.

It also promotes workshops for the general public, as well as tutorials with techniques for reusing and repairing clothes, raising awareness of the importance of adopting behaviors that allow saving and reusing resources.

**Impact** 

Following the principles of circular economy, Vintage for a Cause promotes and encourages the return of clothes at the end of life, for reuse. It thus functions as a collaborative platform for *up cycling*, involving designers, clothing brands and Portuguese industry. With the assumption that each piece can have a new life, the brand creates exclusive designs using textile waste, through sustainable processes and at prices that allow the consumer to be part of the process of transition from fast fashion to sustainability.

As a positive impact it has already recovered a ton of textile waste through *up cycling* until now. And in order not to lose the track of its ecological footprint, the brand also registers CO2 and water savings for each piece it produces. So far, the initiative has already saved 3 million litters of water and 7,000 kg of CO2, and it is expected that, with the growth of the brand, these numbers may triple annually.

Environmental concerns combined with social responsibility have earned to de brand several innovation awards, including an award from the EDP Foundation (through EDP Solidária, in 2013), and an honorable mention by the Green Project Awards in 2017. The brand has been present on the largest ethical fashion platform and fair.

Its great challenges have been the Social Responsibility, because in addition to the issue of sustainability, the project demonstrates social concerns, promoting the training of women over 50 outside of active life, in promoting social entrepreneurship in which to create their own jobs, in promoting active aging. But also in environmental re-education and even in environmental and social activism. Not being a brand with exclusively economic purposes, it was obliged to enable partnerships with other companies to ensure its financial survival.

The brand has been recognized with several awards for its national and international social and environmental role and is increasingly present in the largest ethical and sustainable fashion platform and fair in the world, in Berlin - formerly Ethical Fashion Show and now Neonyt - and, in 2018, started the organization of Fashion Revolution Week in Porto, in partnership with Fashion Revolution Portugal. One of the great success factors of the brand is its activist role in society.

According to the testimony given by the brand founder, Helena Antónia in an interview to the "Ambiente" Magazine (February 2020): "We feel that the only way to achieve an impact is to involve all parties that make up the value chain of the fashion industry - such as (fashion) schools, fashion professionals, consumers and local decision-makers -, so we designed a collaborative business model and social intervention that we believe distributes responsibility and benefits in the most equitable way possible. Personally, I believe that the only way to sustainability is this: to create models, leadership styles and innovations that bring more humanity to society in general, while preserving the environment in a realistic way and adjusted to today". (https://www.ambientemagazine.com/vintage-for-a-cause-ja-desviou-uma-tonelada-de-desperdicio-textil-atraves-do-upcycling/

From all of the above, it can be seen that the entire project / brand is of a sustainable nature (environmental and social), with the greatest constraint being the economic sustainability of the brand.

Thus, the brand has several government or industrial partnerships for its economic viability however its economical sustainability, is achieved in part by selling the brand's garments, which can be purchased through the official website and in partner stores. Part of the proceeds from the sale of the pieces is used to invest in social inclusion, education and awareness programs for sustainability and conscious consumption.

Other Organisations involved

Summary of Open Challenge

This is a project co-financed by European Union, Erasmus + program.

The main objective of this initiative is to foster the university-industry collaboration, to support the development of innovation in the textile sector in Morocco and Jordan, and to generate an ecosystem of advanced textile materials.

The upgrading of existing centers in Morocco and the creation of new innovation centers in Jordan will become a valuable ally for the local textile sector and its further development.

FOSTEX project complies with the national Jordan industrial policy for the years 2017 – 2021 that aims to develop competitiveness in the area of production cost, quality, certification, export and innovation, encouraging applied research and technology transfer from universities to industry.

Similarly, the Moroccan Government established an industrial acceleration plan for the years 2014 – 2020, in which a dedicated strategic line aims to create different industrial ecosystems to promote an integrated development of the sectors. For the textile sector 6 ecosystems are identified, indicating Technical Textiles as one of them.

The initiative aims to set up two advanced textile innovation centres in Jordan and upgrading two textile innovation centres in Morocco, in addition:

- to promote the centres making them the focal points in the textile industry of each country;
- to promote entrepreneurial activities in the four centres to make them regional catalysts of innovation;
- to showcase FOSTEX results and encourage Moroccan and Jordanian governments to replicate the initiatives in other universities.

Target groups Impact The textile and clothing business in Morocco and Jordan

The advanced textiles' centers created in Morocco and Jordan will play the role of focal points for the textile and clothing sector and relevant stakeholders to bloom innovations and promoting entrepreneurship.

The services offered in the centers will enable textile companies of the two countries to be further developed and become more competitive and export oriented by:

- •improving the quality and design of their products,
- •improving the quality and cost effectiveness of manufacturing techniques,
- developing new products,
- •learning about requirements for exporting their products,
- •finding funding opportunities,
- cooperating with other companies and
- •participating in projects.

In addition, the centers will allow the participating HEIs in Jordan and Morocco to:

- promote entrepreneurship among their students,
- •strengthen and foster their relationship with companies,
- promote collaboration,
- •find funding opportunities and
- participate in projects.

Besides the textile sector, the HEIs where the textile centers will be established will have the opportunity to expand the fields of their applied research to topics regarding advanced textiles and innovation.

Through the dissemination activities and tools (roundtables, database of contacts, project website and online collaterals, brochures, newsletters and recommendations) that will be developed and implemented in the two countries during the project's lifespan, the following target groups will be reached and informed about the project and its outcomes as well as its potential results: Relevant stakeholders such as companies, BIOs, policymakers, training centers, investment promotion agencies, corporate executives and investors, International Finance Institutions providing funds for development, researchers and academics and representatives of civil society. Entrepreneurship in the textile sector could generate dignified opportunities for refugees in Jordan.

Textile sector in Morocco and Jordan is mostly made up of small and medium sized companies accounting. The enterprises of the sector are characterized by limited technical and financial capabilities regarding innovation and research and development activities. On the other hand, they hold huge latent innovation capacity due to the large amount of employment textile industry has. Jordan, additionally, has a lot of potential manpower coming from the integration of refugees and new EU-Jordan collaborations.

FOSTEX project seeks to provide the textile sector of these countries a push toward more added value products or advanced textiles. This will be done with the setting up of 2 advanced textiles centers in Jordan, upgrading 2 centers in Morocco and promoting entrepreneurship on all centers with the goal to become catalysts centers. The laboratories will be equipped with quality control equipment in order to offer testing of advanced textiles and production to improve the quality of the products and become more competitive. In additional, those centers will also be focused for entrepreneurs to facilitate testing on the development of new products. The placement within universities will offer a synergistic effect by closing the gap between academia and industry, promoting entrepreneurship and innovation and facilitating a bridge for university students towards industry.

Information about new trends, training in innovative and environmental friendlier manufacturing techniques, innovative ways of organization of

Innovation

production, certification of products, ways to lower production costs and increase of productivity, development of quality products, information about investment and funding opportunities are all innovative services that will be offered to the Jordanian and Moroccan textile sector through the establishment of the advanced textiles' centers.

- The national textile sectors embrace the venture
- The national policymakers support the venture with funds and policies
- Students are willing to become entrepreneurs

These issues are not expected to cause problems in effective implementation, because:

- Partners have strong network of relevant local stakeholders and they also have the will to actively participate in the project.
- Funding is ensured for the implementation period-. Furthermore, the project aims, are in line with national policies and priorities in Morocco and Jordan.
- Training is implemented through a modern, effective, up to date capacity building program that ensures tangible benefits for the participants. A set of training flexible tools (virtual common work space, website, social media) is employed in this program and the trainers are experts from EU textile sector.
- Number of trainess and companies-SME's participating in the project
- Establishment of new companies and partnerships, research and innovation centers
- Increase in textile and clothing exports, in the long term
- Production of products with better quality and/or more added value in local market, in the long term.

Not relevant, since the project is on progress

The sustainable business model, adapted to local socioeconomic conditions, for the operation of the 4 advanced textiles, will provide means to reach the target groups after the lifespan of the project.

The textile centers with their trained staff will continue to offer the services to companies of the textile sector, entrepreneurs that are developing new solutions using advanced textiles and students aiming to start-up and relevant stakeholders in the two countries. Additionally, new services will be included in the centers for testing of advanced textile products, training, certification, seminars, informative events regarding trends and funding tools for the sector.

Researchers will also be given opportunities to work on topics regarding textile and its manufacturing using the already existing new equipment in the textile centers. With the support of the textile centers, the textile companies will be able to participate in various R&D national or international projects.

The collaboration website platform that will be set up, will continue its operation even after the end of the project, It will be a collaborative workspace, ground of new projects and joint activities during and after the end of the project. It will have the following tools: will contain chat, space for videos and contents, community, personal profiles of users, etc. This will assure the involvement of participating institutions as well as main stakeholders after the end of the project.

Furthermore, all project materials developed during this project (training materials, national reports, etc.) will remain available online after the ending of the project on the project website for stakeholders and key target groups, so that they benefit from it.

Italy

Other Organisations involved

80 members, divided into 76 companies, 2 research centers and 2 reference associations; representing almost all the provinces in Piemonte with a majority of members from Biella (52 members) and Torino (12).

It's now increasing the number of textile enterprises established in other Regions that become member of Po.in.Tex (Lombardy, Tuscany, Abruzzo).

Summary of Good Practice

Since its foundation, the goal is to promote the values of cooperative innovation and competitiveness, while encouraging a constant exchange between the innovation supply and demand. There is a particular calling in a territorial sphere that strongly connects this Cluster, its mission and its activities, to the textile industry that still marks the district of Biella and the entire Piemonte Region. The Textile Innovation Cluster includes and serves various members belonging to each part of the textile production and manufacturing sector:

- Apparel
- Textile machinery
- Technical textile
- Leather industry
- Shoe industry
- Automotive
- Furnishing
- Medical
- Chemical industries
- Related research centers

Target groups

Impact

The majority of our Cluster's members are small and medium-sized enterprises. However, there is a significant share of the major textile brands. Getting to know companies and analyzing their strategic needs, business models, strengths and gaps. It promotes collaboration between companies and between research centers including technology transfer. It also highlights new initiatives and needs of the textile companies, presenting them to policy makers.

Innovation

The Cluster is active in promoting best practices at an international level, as well as end-user research and in establishing partnerships. The Cluster encourages and supports access to Regional and European Calls for product and process innovation projects and also supports innovation through educational programs, always in line with the technological development and the company's needs.

Constraints	The Cluster has to engage with local stakeholders and sometimes it can be difficult.
Success Factors	Since it has been founded, the Cluster has taken part in 13 success projects (at International, European and National level), taking advantage of a wide range of funds programmes.
Lessons learned	Starting from local realities, it can be possible to reach other areas.

TCBL Textile & Clothing Business Labs is a European Union's Horizon 2020 Programme for research, technology development, and innovation under grant Agreement n.646133. Its aim is to built a multi-faceted business ecosystem of sector enterprises, innovation labs, service providers and advisors who are working together to transform the Textiles and Clothing industry. The common objective is to build alternative, sustainable paths to over-production and diminishing value. TCBL was a project funded by the European Union's Horizon 2020 programme.

Countries participating

Italy, Germany, United Kingdom, Belgium, Greece, France, Spain, Netherlands, Romania, Portugal, Slovenia

Other Organisations involved

German Institutes for Textile and Fiber Research - Center for Management Research (DITF), Istituto Superiore Mario Boella, Skillaware, The Open University, IMEC, Tavistock Institute, Materials Industrial Research & Technology Center S.A., MIRTEC, Waag Society, Huddersfield & District Textile Training Company Ltd, The eInstitute (eZavod), Consorzio Arca, Unioncamere del Veneto (UCV), Hellenic Clothing Industry Association, Sanjotec - Centro Empresarial e Tecnológico, Clear Communication Associates Ltd, Oxford Brookes University, Association Reginnova NE, Centre Scientifique & Technique de l'Industrie Textile Belge, Institut Français de la Mode (IFM), Institut d'Arquitectura Avancada de Catalunya – Fundacio Privada (FabTextiles), Cleviria, Sqetch BV.

Summary of Open Challenge

The goal of the TCBL Project has been to create a transformational business ecosystem capable of constantly innovating the business and process models of the European Textile and Clothing industry. As customers are showing increasing attention to ethical and environmental sustainability in the clothes they wear, significant opportunities for meeting this challenge are emerging based on new production and distribution technologies, innovative organizational models, and new creative energies. If these opportunities are adequately captured through business model innovation, these trends have the promise of radically re-structuring one of the globe's most consumption-oriented and environmentally unfriendly industries.

Target groups

It brings together 22 organisations from 11 EU Member States and it is addressed to enterprises, innovation labs, research centres, universities, FabLabs, sector associations, training centres, software houses, and social and socio-technical research centres, service providers and advisors of Textile and Clothing industry.

Impact

The wealth of value created in the four years of the TCBL Project is being capitalised through the TCBL Foundation, the structure currently being established by key project partners entrusted with carrying forward the network's activities. The TCBL Foundation's Business Plan and a growing number of strategic partnerships bode well the long-term sustainability. TCBL is thus expected to have a widespread impact on the T&C industry in

Europe, shifting consumer goals, expectations, and even engagement in the processes of designing and making clothes. This in turn will have both social and environmental impacts, as well as significantly improving the prosperity of Europe's diffused systems of production.

Innovation

This in turn aims to bring 5% of production capacity back to Europe and reduce the sector's environmental footprint by 20% by 2025. The needs and ideas of ecosystem participants took concrete form through the activation of innovation projects involving cooperation between and among Labs and Associates. Some were initiated by the research agendas of one or more Labs, some by Associates wishing to collaborate across supply chains to test a market idea, while some were driven by TCBL partners inspired by possible innovation scenarios.

Constraints

One of the main challenges of the TCBL Project has been to engage with external organizations in the role of Lab or Associate, building a value-based community of players wishing to make a difference. Each joined TCBL on the basis of a set of shared principles, and has expressed needs and aspirations for new directions and concretely participated in innovation actions, all with no direct financial support from the project.

Success Factors

This process is supported by federated knowledge, learning and business services that are aggregated through the TCBL Open Platform.

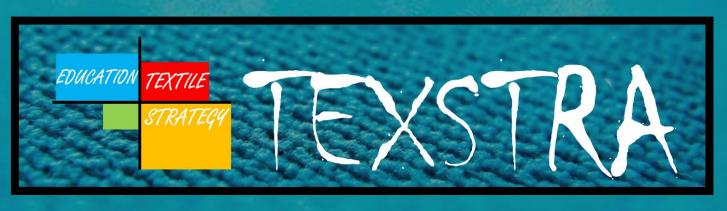

Lessons learned

This process is being driven by a network of over 50 TCBL Labs that freely experiment the implications of potential innovations and their concrete impacts on business operations. A broad range of structures, from materials research laboratories to design collaboratives and social community centres, explore innovation potentials from varying mixes of three perspectives – design, making and place – and engage with other labs, the local community, and T&C businesses – TCBL Associates – through concrete projects.

In turn, TCBL Associates capture these innovation potentials and apply them in concrete actions — Innovation Projects — that accompany their shift towards more innovative and competitive business models.

Sustainability

Total budget: over 8 million Euros

Co-funded by the Erasmus+ Programme of the European Union
